

RupeeTrack

Smart student expense management — offline, zero dependencies, built for real hostel life.

PROBLEM STATEMENT

Hostel life taught me this the hard way — Rs.50 chai, Rs.120 delivery, random UPI splits, a subscription I forgot I had. None of it feels like real spending in the moment. But by the 20th you're staring at your balance wondering where it all went.

Every app I tried wanted an account, internet, or more effort than the problem deserved. I wanted something simple that opens instantly, works offline, and actually helps students understand their spending — not just log it.

YOUR PROCESS

Started with the bare minimum: add expense, view expenses, calculate total. Then I kept asking one question — *would I actually open this tomorrow?*

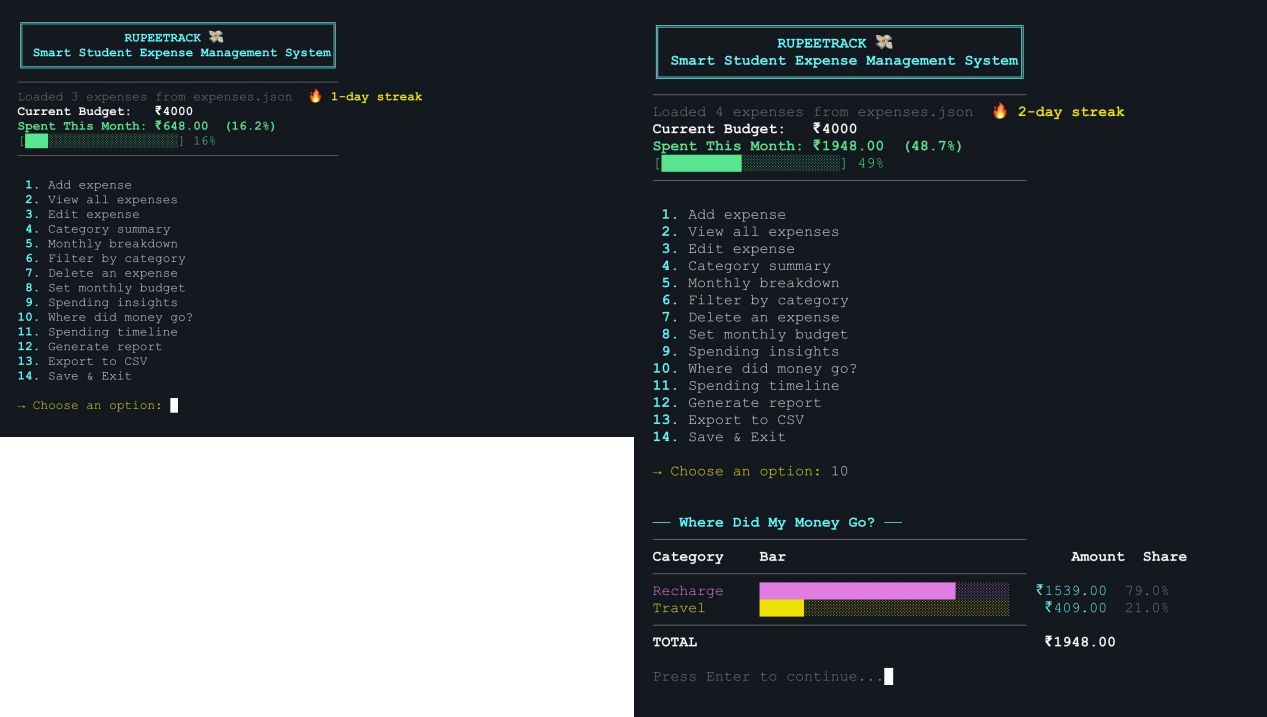

Usually the answer was no. So I kept building. Budget warnings because I kept overshooting without noticing. A health score because raw numbers don't mean anything without context. Terminal charts because scrolling a list isn't the same as seeing a pattern.

Broke stuff, fixed stuff, cut stuff that got too clever. The constraint of zero external libraries actually made decisions easier — if it couldn't be done simply, it probably shouldn't be done.

KEY PROCESS STEPS

Step 1 Core tracking — add, edit, delete, and validate expenses	Step 2 Persistence & budgets — data that survives closing the terminal
Step 3 Insights & visuals — health score, personality, timeline, categories	Step 4 Reliability — corrupted file recovery, edge cases, export

SCREENSHOTS

Main menu with live budget bar · Category spending breakdown

RESULTS & OUTCOMES

24+	0	100%
Features shipped	External dependencies	Offline

What started as a basic tracker became a full offline finance tool. Runs anywhere Python runs — no setup, no accounts, no internet.

I opened it this morning to log my own expenses. That's probably the only metric that matters.

FUTURE IMPROVEMENTS

- Multi-user profiles for shared hostel rooms
- Recurring expense tracking for subscriptions and rent
- Goal-based savings with milestone tracking
- Optional lightweight graphical dashboard
- Optional cloud sync — offline-first stays non-negotiable
